Amendment Dated February 21, 2007

Reply to Office Action of December 7, 2006

## **AMENDMENTS TO THE CLAIMS:**

1. (Previously presented) A tissue or vessel sealing instrument, comprising:

a housing having a shaft attached thereto; and

an end effector assembly attached to a distal end of the shaft, the end effector assembly including first and second jaw members attached thereto made from a substantially rigid material, the jaw members being movable relative to one another from a first position for approximating tissue to at least one additional position for grasping tissue therebetween;

each of the jaw members including an elastomeric material disposed on an inner facing tissue contacting surface thereof, each of the elastomeric materials including an electrode disposed therein, the electrodes being offset a distance X relative to one another such that when the jaw members are closed about the tissue and when the electrodes are activated, electrosurgical energy flows through the tissue in a generally coplanar manner relative to the tissue contacting surfaces, the elastomeric material being adapted to compress or deflect about 0.001 inches to about 0.015 inches when the force used to close the jaw members is between about 40 psi to about 230 psi; and

wherein the substantially rigid material of the jaw members resists deformation when the force used to close the jaw members is between about 40 psi to about 230 psi.

2. (Previously presented) The tissue or vessel sealing instrument of claim 1, wherein the elastomeric material is selected from the group consisting of at least one of the

following materials: silicone, polyurethane, santoprene, nylon, syndiotactic

polystryrene, Polybutylene Terephthalate (PBT), Polycarbonate (PC), Acrylonitrile

Butadiene Styrene (ABS), Polyphthalamide (PPA), Polymide, Polyethylene

Terephthalate (PET), Polyamide-imide (PAI), Acrylic (PMMA), Polystyrene (PS and

HIPS), Polyether Sulfone (PES), Aliphatic Polyketone, Acetal (POM) Copolymer,

Polyurethane (PU and TPU), Nylon with Polyphenylene-oxide dispersion and

Acrylonitrile Styrene Acrylate.

3. (Previously presented) The tissue or vessel sealing instrument of claim 1, wherein

the offset distance X is in the range of about 0.005 inches to about 0.200 inches.

4. (Previously presented) The tissue or vessel sealing instrument of claim 1, further

comprising at least one sensor which provides information to a feedback circuit for

regulating the electrosurgical energy through the tissue.

5. (Previously presented) The tissue or vessel sealing instrument of claim 4, wherein

the sensor measures at least one of tissue impedance, tissue temperature and tissue

thickness.

6. (Withdrawn) The electrosurgical instrument of claim 1, wherein at least one of the

jaw members includes means for regulating the distance X dependent upon tissue

thickness or tissue type.

Amendment Dated February 21, 2007

Reply to Office Action of December 7, 2006

7. (Previously presented) The tissue or vessel sealing instrument of claim 1, wherein

at least one of the jaw members includes at least one electrode across the width

thereof and the electrosurgical instrument includes means for selecting one of the

electrodes for electrically opposing the electrode disposed on the other of the jaw

members, wherein the means includes a sensor which measures at least one of tissue

impedance, tissue temperature and tissue thickness.

8. (Previously presented) The tissue or vessel sealing instrument of claim 1, wherein

the elastomeric material has a comparative tracking index value of about 300 to about

600 volts.

9. (Withdrawn) The electrosurgical instrument of claim 1, wherein the electrodes are

wire electrodes which project from the tissue contacting surfaces of the elastomeric

material into contact with the tissue.

10. (Withdrawn) The electrosurgical instrument of claim 1, wherein the elastomeric

material on each of the jaw members includes an electrode which is partially disposed

therein.

11. (Withdrawn) The electrosurgical instrument of claim 10, wherein upon grasping of

tissue between the jaw members, each of the electrodes deflect inwardly relative to the

tissue contacting surfaces.

- 12. (Withdrawn) The electrosurgical instrument of claim 11, wherein the electrodes are recessed within the elastomeric material.
- 13. (Withdrawn) The electrosurgical instrument of claim 12, wherein the tissue contacting surface of each electrode is substantially crowned.
- 14. (Withdrawn) An electrosurgical instrument for sealing tissue, comprising: a housing having a shaft attached thereto; and

an end effector assembly attached to a distal end of the shaft, the end effector assembly including first and second jaw members attached thereto, the jaw members being movable relative to one another from a first position for approximating tissue to at least one additional position for grasping tissue therebetween;

each of the jaw members including an insulative material disposed on an inner facing tissue contacting surface thereof and an elastomeric material disposed between each jaw member and a respective insulative material, each of the insulative materials includes an electrode disposed therein, the electrodes being offset a distance X relative to one another such that when the jaw members are closed about the tissue and when the electrodes are activated, electrosurgical energy flows through the tissue in a generally coplanar manner relative to the tissue contacting surfaces.

15. (Withdrawn) The electrosurgical instrument of claim 14, wherein the offset distance X is in the range of about 0.005 inches to about 0.200 inches.

16. (Withdrawn) The electrosurgical instrument of claim 14, further comprising at least one sensor which provides information to a feedback circuit for regulating the electrosurgical energy through the tissue.

17. (Withdrawn) The electrosurgical instrument of claim 16, wherein the sensor measures at least one of tissue impedance, tissue temperature and tissue thickness.

18. (Withdrawn) The electrosurgical instrument of claim 14, wherein at least one of the jaw members includes a plurality of electrodes across the width thereof and the electrosurgical instrument includes means for selecting one of the plurality of electrodes for electrically opposing the electrode disposed on the other of the jaw members, wherein the means includes a sensor which measures at least one of tissue impedance, tissue temperature and tissue thickness.

- 19. (Withdrawn) The electrosurgical instrument of claim 14, wherein the insulative material on each of the jaw members includes an electrode which is partially disposed therein.
- 20. (Withdrawn) The electrosurgical instrument of claim 19, wherein the electrodes are recessed within the insulative material.

Amendment Dated February 21, 2007

Reply to Office Action of December 7, 2006

21. (Previously presented) A tissue or vessel sealing instrument, comprising:

a housing having a shaft attached thereto; and

an end effector assembly attached to a distal end of the shaft, the end effector assembly including first and second jaw members attached thereto made from a substantially rigid material, the jaw members being movable relative to one another from a first position for approximating tissue to at least one additional position for grasping tissue therebetween;

each of the jaw members including an elastomeric material disposed on an inner facing tissue contacting surface thereof, each of the elastomeric materials including an electrode disposed therein, the electrodes being offset a distance X relative to one another such that when the jaw members are closed about the tissue and when the electrodes are activated, electrosurgical energy flows through the tissue in a generally coplanar manner relative to the tissue contacting surfaces, wherein the elastomeric material is selected from the group consisting of at least one of the following materials: silicone, polyurethane, santoprene, nylon, syndiotactic polystryrene, Polybutylene Terephthalate (PBT), Polyphthalamide (PPA), Polymide, Polyethylene Terephthalate (PET), Polyamide-imide (PAI), Acrylic (PMMA), Polystyrene (PS and HIPS), Polyether Sulfone (PES), Aliphatic Polyketone, Acetal (POM) Copolymer, Polyurethane (PU and TPU), Nylon with Polyphenylene-oxide dispersion and Acrylonitrile Styrene Acrylate, the elastomeric material being adapted to compress or deflect

wherein the substantially rigid material of the jaw members resists

deformation when the force used to close the jaw members is between about 40
psi to about 230 psi.

## 22. (Currently amended) A tissue or vessel sealing instrument, comprising:

a housing having a shaft attached thereto; and

an end effector assembly attached to a distal end of the shaft, the end effector assembly including first and second jaw members attached thereto made from a substantially rigid material, the jaw members being movable relative to one another from a first position for approximating tissue to at least one additional position for grasping tissue therebetween;

each of the jaw members including an elastomeric material disposed on an inner facing tissue contacting surface thereof, the elastomeric material being adapted to compress or deflect about 0.001 inches to about 0.015 inches when the force used to close the jaw members is between about 40 psi to about 230 psi, each of the elastomeric materials including an electrode disposed therein, the electrodes being offset a distance X relative to one another such that when the jaw members are closed about the tissue and when the electrodes are activated, electrosurgical energy flows through the tissue in a generally coplanar manner relative to the tissue contacting surfaces, wherein the offset distance X is in the range of about 0.005 inches to less than 0.04 about 0.200 inches; and

wherein the substantially rigid material of the jaw members resists deformation when the force used to close the jaw members is between about 40 psi to about 230 psi.

23. (Previously presented) A tissue or vessel sealing instrument, comprising:

a housing having a shaft attached thereto; and

an end effector assembly attached to a distal end of the shaft, the end effector assembly including first and second jaw members attached thereto made from a substantially rigid material, the jaw members being movable relative to one another from a first position for approximating tissue to at least one additional position for grasping tissue therebetween;

each of the jaw members including an elastomeric material disposed on an inner facing tissue contacting surface thereof, each of the elastomeric materials including an electrode disposed therein, the electrodes being offset a distance X relative to one another such that when the jaw members are closed about the tissue and when the electrodes are activated, electrosurgical energy flows through the tissue in a generally coplanar manner relative to the tissue contacting surfaces, the distance X being variable depending on the thickness of the tissue between the jaw members, the elastomeric material being adapted to compress or deflect about 0.001 inches to about 0.015 inches when the force used to close the jaw members is between about 40 psi to about 230 psi; and

Appl. No. 10/712,486 Amendment Dated February 21, 2007 Reply to Office Action of December 7, 2006

wherein the substantially rigid material of the jaw members resists deformation when the force used to close the jaw members is between about 40 psi to about 230 psi.
